

## Appendix A Chemical Properties Calculation

*Drug-likeness* (QED) scores are calculated based on eight molecular descriptors: molecular weight (MW), octanol-water partition coefficient (ALOGP), number of hydrogen bond donors (HBDs), number of hydrogen bond acceptors (HBAs), molecular polar surface area (PSA), number of rotatable bonds (ROTBs), number of aromatic rings (AROMs), and number of structural alerts (ALERTS). The mathematical description is as follows:

$$QED = e^{\frac{\sum_{n=1}^8 W_n \ln d_n}{\sum_{n=1}^8 W_n}}, \quad (1)$$

where  $d_n$  and  $W_n$  are the desirability function and the weight of  $n$ -th molecular descriptor, respectively.

*Solubility* (LogP) is determined from the partition coefficient. This coefficient represents the equilibrium concentration ratio of a molecule between two nonmixing solvents. It is calculated as follows:

$$\log P = \log\left(\frac{c_o}{c_w}\right), \quad (2)$$

where  $c_o$  represents the substance activity in the organic phase and  $c_w$  indicates the one in water phase.

*Synthesizability* (SA) is calculated as follows:

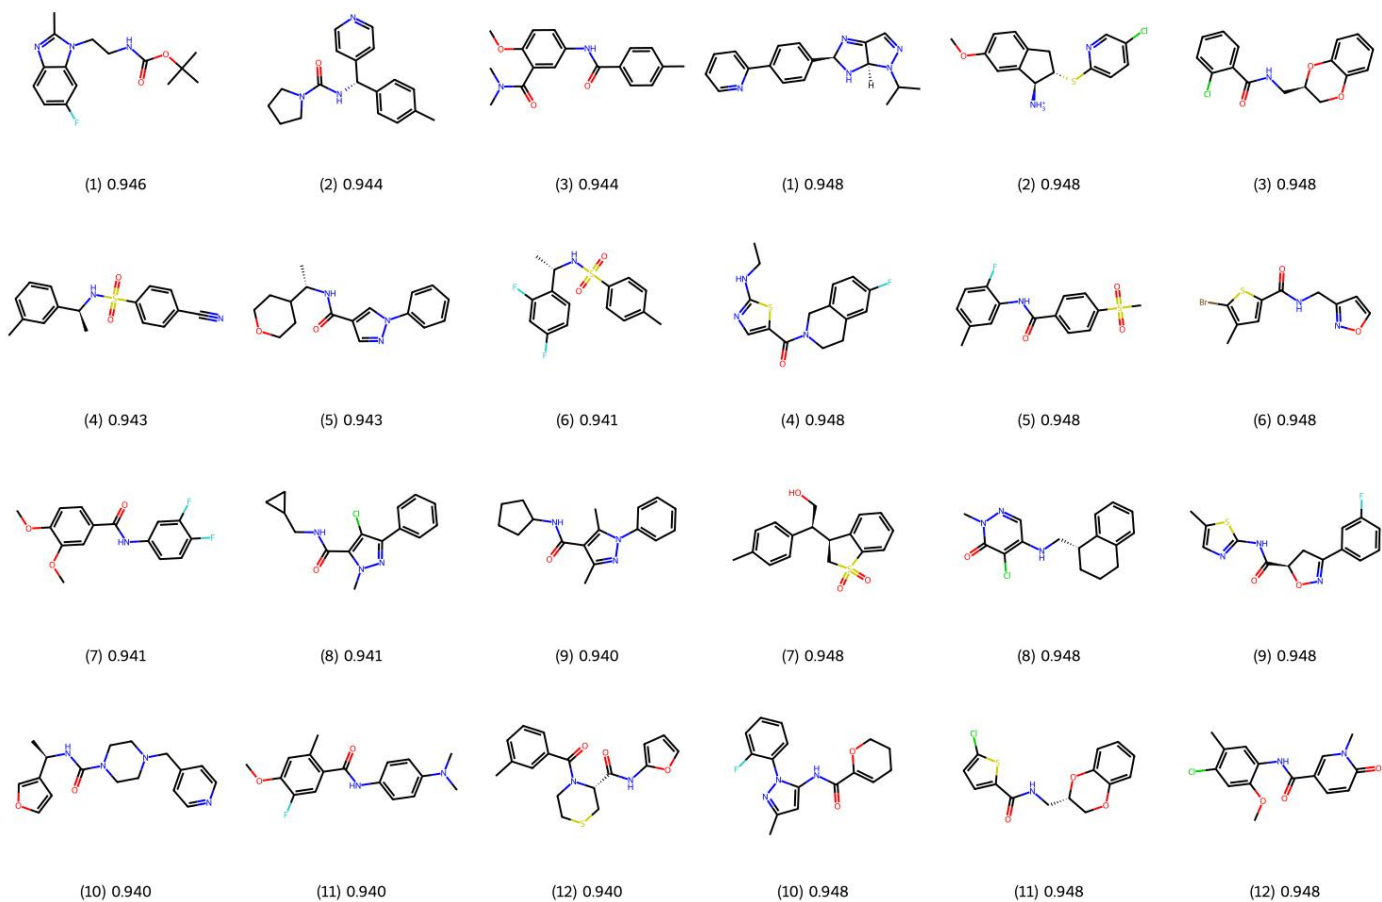

$$SA = r_s - \sum_{n=1}^5 p_n, \quad (3)$$

where  $r_s$  is the ratio of the total contributions of all segments to the number of segments in the molecule. This ratio is obtained from the analysis of synthetic molecules. We obtained  $r_s$  from the SpotGAN [37].  $p_n$  ( $n \in 1, \dots, 5$ ) represents five features: ring complexity, stereo complexity, macrocycle penalty, size penalty, and bridge penalty.

For implementation, the QED scores are computed directly by `RDKit.chem.QED.qed` in the RDKit tool. The QED scores range from 0 to 1. The Logp and SA scores also use the RDKit tool, but we have normalized and clipped them from 0.1 to 1. The higher these scores are, the more desirable these properties are.

## Appendix B Experimental Details

Since the novelty of these baselines is based on the proportion of valid SMILES strings not present in the training dataset, we also include the same novelty (65.37%). To facilitate future research in this field, we also provide the novelty (99.73%) based on valid SMILES.
